Thermo Scientific Sensititre plate setup guide

For anaerobic organisms (B. fragilis group)

1. Pick 3-5 colonies from agar plate and emulsify in 5 mL Thermo Scientific™ Mueller Hinton Broth

2. Adjust suspension to 0.5 McFarland equivalent using the Thermo Scientific™ Sensititre™ Nephelometer

3. Transfer 100 µL to 11 mL Thermo Scientific™ Supplemented Brucella Broth for Anaerobes

4. Inoculate the panel with 100 µL per well using the Thermo Scientific™ Sensititre AIM™ Automated Inoculation Delivery System

5. Cover all wells with the perforated adhesive seal. Incubate in an anaerobic jar or chamber at 34-36 °C anaerobically for 46-48 hours*

6. Read results using the Thermo Scientific™ Sensititre™ Vizion™ System or Thermo Scientific™ Sensititre™ Manual Viewbox

To meet your laboratory quality assurance guidelines

Quality control testing
Analyze appropriate quality control organisms with known MIC values (e.g. ATCC strains, available from Thermo Scientific™ Culti-Loops™ product portfolio) to confirm reliable performance of your consumables and workflow.

Colony count
After inoculating the broth, transfer 100 µL from the remaining broth into a new 11 mL Mueller-Hinton broth. Incubate overnight and count the colonies. Expected results should fall into the range of 50-500 colony forming units.

Purity check
Streak 1 µL from the positive control well or remaining broth directly on to an appropriate agar plate and incubate as required.
